Though “The Problem with “Learning styles”” article is providing evidence, I have to heavily disagree. For myself, I have always wondered if learning styles truly make a difference. Through having many different teachers or professors teaching me in completely different styles, I have found that I perform better in my classes that adhere to my learning style. I received a 60 for visual learning on my learning style quiz, and this style has always helped me learn. When I continued my education as a fully online student after the pandemic, my grades have highly improved. Sitting in lectures having to listen and retain information from one person was never my desired way of learning. I would go home from class retaining 0 information. Now that I have control over what I read, watch, and listen to; I have retained information much better. I enjoy videos that I can watch and read, because it keeps me entertained while processing the information. Learning styles do affect how we learn, but I also believe we all have a bit of each.
