Graphical User and Command-Line Interface

Graphical User Interface is what I have used for many years. This one is what I prefer, but only because it comes easiest to me. I am more of a visual learner, and using GUI allows me to see pictures or emoticons that represent what folder or file I am searching for. GUI may come easier to me, but I do find Command-Line interface extremely interesting. I want to learn more about how to use it and begin to practice using it. It seems more difficult to me because I have never used it before and having to memorize a new way of searching and seeing my folders does feel a bit scary. I feel like this could be the easier method of controlling, searching, renaming, etc. It would have to take a bit of practice, but I find it super interesting. Being new to code I have all new things to learn, so this is something I can begin practicing. Instead of using my mouse and searching, scrolling, etc. using just text would give me a faster result. On the other hand, there are many files I have saved where I have absolutely no clue what the names are, especially from a long time ago. When I am searching for something with no knowledge of the name, then I would have to resort back to GUI instead, so I am able to find it using the image.
